

KYC SURVEY EDITABLE

KYC survey — AI-adjustable and human-adjustable

The Know-Your-Customer onboarding survey (interest personalization, not identity KYC) is no longer hardcoded. It's stored and editable, and can be adjusted two ways: by a human admin, and by AI.

Stored, not hardcoded

The active survey lives in a `KycSurveyConfig` singleton and is resolved at request time (`getActiveSurvey()` → the saved/approved survey, or the built-in `KYC_SURVEY` default if untouched). `kycSurveyGet` serves the active survey; members always see the current version. Every edit is validated by `validateSurvey()` (unique ids, valid types, ≥ 2 options for choice questions, caps) so a bad edit can't corrupt onboarding. Answers to custom questions are saved and fed to the chatbot/AI.

Human adjustment

Admin-only **KYC Survey Editor** page: edit the title/description, add/remove/reorder questions, change types, edit options, mark required, then **Save & publish** (or **Reset to default**). Backed by `kycSurveyAdminGet` / `kycSurveyAdminSave`, with every change written to the admin audit log.

AI adjustment

`kycSurveyAISuggest` analyzes the real distribution of past answers (which questions discriminate, which options nobody picks, gaps to fill) and proposes an improved survey with a written rationale. By default the proposal is **staged for human approval** (`kycSurveyProposalDecide` → approve/reject). If `kyc_survey_ai_autopublish` is ON (default ON under the AI-on posture) — and the global AI kill switch isn't engaged — the AI publishes the new survey live and logs it to the AI oversight feed.

Flags, settings & entities

Flag: `kyc_survey_ai_autopublish` (default ON; respects the `ai_paused` kill switch). Entity: `KycSurveyConfig`. Functions registered in the manifest: `kycSurveyAdminGet`, `kycSurveyAdminSave`, `kycSurveyAISuggest`, `kycSurveyProposalDecide`. The reward + one-time gate behavior is unchanged.
