

Counsel Note — Feature Catalog + PMF (2026-09-05)

Counsel Note — Tiered Feature Catalog + AI PMF/Revenue Agent (2026-09-05)

*For the attorney. Documents the product/infra features added on 2026-09-05 and confirms they were built to preserve every existing constraint. Nothing here creates a new money-movement, credit, or identity surface. **Not legal advice** — the confirm-points at the end are for counsel.*

What was added

1. **Tiered advertiser feature catalog** (`advertiser-features.ts`). The advertiser-facing revenue streams (the subset of the 8-category revenue map an advertiser actually buys — sponsored surveys, audience panels, brand-lift/insight reports, in-app placements, lead-gen, and the gated offerwall/rewarded-video/API/ AI-creative options) are now presented as **add-on features across Tiers 1-3**. User-facing streams (cosmetics, boosts) and structural fees are **not** tier features.
2. **AI Feature PMF scoreboard** (`feature-pmf.ts`). Ranks each advertiser feature by product-market fit, **retention-weighted**, using adoption, engagement, the feature's own revenue (its slice of the existing `RevenueEvent` ledger), and a return-rate. A light `FeatureUsageEvent` log records that a feature was used.
3. **AI PMF & revenue agent** (`pmf-agent.ts` , scheduled). Collects the above signals into the existing `OptimizationSignal` trend store, produces a per-feature action plan (promote/hold/watch/fix/sunset with an advisory pricing direction), records learning, and runs continuously.

Guardrails preserved (the point of this note)

- **No revenue/ROI/return promise anywhere.** Tier “value” remains **advertising value delivered** at conventional rates, exactly as in the existing TIER1/2/3 value-stack docs. Pricing is **held**; adding live features only makes the *delivered-value ratio* climb — no number is tied to an advertiser's sales.
- **Nothing is oversold.** A **gated** feature (needs a third-party account) or **counsel** feature contributes **\$0** of claimed value and is labeled “activates when its prerequisite lands” until it is actually live — the same on/off-toggle rule the value stacks already follow.
- **The closed loop is untouched.** No feature here books money to a user, creates a cash-equivalent, or moves value user-to-user. Users still receive only non-cashable Site Cash; only businesses are paid real money.
- **Every sensitive move stays human-gated.** The AI agent **writes an advisory plan and learning only**. It does **not** auto-change money, pricing, tiers, identity, or legal settings. Each price/tier/sunset move is flagged “needs approval” and routed through the same admin-approval path the optimizer and Autonomy Kernel already enforce (money/identity/legal are permanent human gates). No new autonomy over regulated domains.
- **The founding PMF panel is a measured PRIVILEGE, not a quota.** Founding / pre-revenue Tier 1 members get the whole catalog free and are *asked* to exercise features; the system only **observes** usage. There is **no** “use N features / give M pieces of feedback → get \$X” mechanic — it is not compensation for feedback, consistent with the existing founding-offer framing (feedback/beta role is a founding privilege).
- **Privacy posture unchanged.** `FeatureUsageEvent` is aggregate product analytics of the same first-party interaction signals already collected and disclosed (feedback auto-collection,

telemetry, session capture). No new category of personal data, no third-party sharing; it feeds internal ranking only.

- **18+, jurisdiction, disclosure, and consent gates** are all upstream of these features and unchanged.

For counsel to confirm

1. That presenting the advertiser revenue streams as tiered add-on features — with price held and only *live* features counted toward delivered value — stays within the existing value-stack / no-performance-guarantee posture already reviewed.
2. That the `FeatureUsageEvent` product-analytics collection is covered by the current privacy policy and data disclosures (it reuses already-disclosed first-party signals; no new data category or sharing).
3. That an AI agent which **only** produces advisory recommendations + learning — with every price/tier/money change held for human approval — introduces no new autonomy concern beyond the already-reviewed optimizer / Autonomy Kernel model.
4. That the founding “whole catalog free, please help us find fit” framing remains a **privilege**, not compensation for labor, given there is no quota and no payment tied to feedback.
