

STORE SORT AND ONE CLICK

Store sort control + one-click “Buy now”

Two Amazon-style storefront additions shared by the Physical and Digital stores.

Sort control (top of the results)

A standard sort dropdown sits at the top of the results in both stores, with the same set of options a shopper expects from a large retailer:

- **Featured** (relevance — keeps the source order)
- **Price: Low to High**
- **Price: High to Low**
- **Avg. Customer Review**
- **Newest Arrivals**
- **Best Sellers**

Implementation is a single shared module, `src/lib/storeSort.js`, exporting `SORT_OPTIONS` and `applySort(listings, sort)`. Both `PhysicalStore.jsx` and `DigitalStore.jsx` import it, so the control is identical across stores. Sorting uses whatever listing fields are available with **graceful fallbacks** (rating reads `rating ?? avg_rating ?? stars`; sales read `sold_count ?? purchases ?? sales ?? order_count`; newest reads `created_at ?? created_date`), so it works before ratings/sales data exists — missing fields sort as 0 / stable rather than breaking.

One-click “⚡ Buy now” (log immediately, then confirm to complete)

A prominent one-click button on every listing card, for buyers with a card on file. The flow is deliberately two-step so intent is captured in one click **without** committing a charge:

1. **One click logs the order immediately** — an `Order` is created in `awaiting_payment` state, `payment_captured: false`. It is **not** a completed purchase, and it does **not** claim the listing (an unpaid one-click order never locks a one-of-a-kind item).
2. **A prompt then asks the buyer to complete the purchase** — “Order logged — complete your purchase?” Nothing is charged until they confirm, and a card is on file. If no card is on file, the prompt tells them to add one; the order stays saved until then.

Nothing is actually charged until the external payment processor path is live — `card_charging` remains **OFF** until “processor + legal sign-off”, so today the confirm step records intent and routes the buyer to `add/confirm` a card rather than moving money.

Backend — `oneClickPurchase`

`backend/functions/oneClickPurchase/entry.ts` (registered in `_manifest.json`). It validates the listing (active, not affiliate, not the buyer’s own, `price > 0`), computes the marked-up total with any

markup-funded welcome credit (capped so the charge never drops below base), applies the same **affordability warning** as the rest of the store, and logs the order. It also honors the **teen/ household gate** (purchaseGate): a teen order that needs sign-off opens as pending_approval and notifies the adult holder instead of awaiting_payment. The handler never touches raw card numbers.

Frontend

PhysicalStore.jsx and DigitalStore.jsx each render the amber < **Buy now** button, call oneClickPurchase, reuse the existing affordability-warning modal, and show the “complete your purchase?” confirmation modal on success.

Flags & settings

Reuses existing controls: STORE_MARKUP (10%), PHYSICAL_AFFORDABILITY_LIMIT USD (\$1,460), PROMO_FUNDED_BY_MARKUP, and the card_charging flag (OFF until processor + legal sign-off).
